

NAOMS

NAO MEMORY SYSTEM · SOVEREIGN COMPUTE

DESIGN NOTES · FOR ANDREW

The regen calendar. Never miss an event that connects you.

You built the events map this grows from. This note explains, in plain words, what we are building on top of it, shows the screens as they look today in **dark and light**, says honestly what could go wrong and how we guard against it, and asks for your view on a few choices that are **yours as much as ours**.

WHERE TO START

- §01 **The goal** — one sentence, and what it means.
- §02 **How it works for people** — the calendar hive, linking, stewards, glow.
- §03 **The screens** — dark and light side by side, desktop and phone.
- §04 **Privacy and trust** — what we guard against.
- §05 **Decisions for you** — the only section that asks anything of you.
- §06 **What is next.**

FROM	NAOMS · on behalf of Mujo, NAOMS owner
TO	Andrew · author of regen-events-map
DATE	2026-09-29
EDITION	Second edition. Two things changed since the first copy: the regen calendar is now its own hive, and linking an organisation works differently (see §02).
STATUS	Design stage. The screens are design mock-ups , not the finished app, and all names and events in them are sample content. Anything still undecided is marked DECISION .

Public edition

This is the public edition of a document we sent to Andrew.

Pages that are internal working detail, or that describe engineering items we have not finished, have been withheld.

Nothing else has been changed.

Original document: 15 pages.

Withheld original pages: 13.

Original pages shown, in order: 1-12, 14-15.

01 • The goal

How might anyone in the regen community, wherever they are, never miss an event that connects them — through calendars that the people of each channel curate together?

Here “channel” means a community of people around a topic. In the design as it now stands, the regen calendar’s community has a home of its own: a hive (see §02).

Mujo, who owns NAOMS, approved this sentence as the goal. It came from a simple felt problem, in his words: nobody should ever say “I didn’t know that event was happening next door in my city, or the city I’m just visiting.” The calendar is **worldwide, not regional**.

Two things shape everything else. First, the regen calendar is **its own hive** — a shared space in NAOMS for a group of people, here those who gather around regeneration. The hive’s **stewards are the curators**: they look after the calendar together. There is no separate “channel” thing behind it. Second, the anti-goal, again in the owner’s words: it must not become *a marketing channel for a single entity*; it is *a collaborative agenda*.

◆ What grows from your prototype

- **The map and the browsing feel** of your events map, redrawn as a modern app rather than a website.
- **Your resonance idea**: signal interest, see that friends are going, say “I’m going”, and let the total help organisers decide whether to fund an event.
- **Your network glow**: an event you might care about grows from a faint line to a sparkling pulse as more of your network shows up for it.

Our reading, for you to confirm. We are treating your repository as a guide to how the calendar should feel, and possibly as a source of starting events — not as code to port. That is our own reading of the plan; it is not something anyone has stated in so many words. Please tell us if it is wrong.

02 · How it works for people

◆ Three layers, one calendar

LAYER	WHAT IT IS
An organisation's own calendar	Each organisation with its own space (a "hive" in NAOMS) keeps its own calendar. The people who run events write to it there, under the organisation's own rules about who may post.
The regen calendar hive	A hive of its own, whose stewards are the curators. Its calendar is the shared calendar. Organisations <i>link</i> to it. Once a link is approved, their Public events appear on the shared calendar by themselves.
Showing it on a hive's space	A linked organisation can show the regen calendar on its own space, so its members see everything the network cares about without leaving home. In the first version, only organisations with an approved link can show it; opening that up later is left as a possible next step.

A person does not need to join the regen calendar hive to have their events appear. They write in their own organisation, and the event travels along the link.

◆ Internal or Public, chosen when you create the event

Every event is either **Internal** or **Public**. New events start as **Internal**. Internal events never leave the organisation. Once the organisation is linked, a Public event goes to the shared calendar **immediately** — and so does any later change, or deletion, with no confirm step and no waiting. The person who posted sees a small "Shared to Regen" note on their own event, so nothing is ever silently pending.

◆ Linking an organisation, and what stewards do

There is no QR code, no link code and no invite to paste. Linking uses two screens NAOMS already has:

- 1. The organisation asks.** A steward of the organisation's hive opens that hive's existing **Trusted hives** settings and adds the regen calendar. That sends a request.
- 2. The curators approve.** The request shows up in the calendar stewards' existing **Approvals** screen. A steward approves it there. Stewards do **not** approve individual posts.
- 3. From then on, events flow.** Once approved, anyone who can write to that organisation's calendar and marks an event Public is synced straight away, and so are their edits and deletions. The owner's reasoning: *"this is a trusted environment, so let's default to trust."* Who may post inside an organisation is that organisation's own business.
- 4. If an organisation is badly run,** the stewards can unlink it. They are asked whether to also **Purge history**. This really does remove the organisation's past events from the regen calendar for everyone who follows it. The honest limit: copies someone already saved elsewhere cannot be recalled.

Linked organisations see calendar events, never chat. What a linked organisation can read from the regen calendar is the calendar itself — events and their pictures — and nothing else that happens in the regen hive, chat included.

Beyond approving and unlinking, the design gives stewards two lighter tools for when cutting off a whole organisation is too much: hiding a single event, and hiding one person's posts. Each event shows who posted it and through which organisation.

◆ Resonance and the glow

On any event a person can mark **Interested** or **Going**. By default only people who hold that person's **friends** relationship card see it — not business contacts, not hives — and the person can change that. Signals also pass quietly to friends-of-friends, but a signal is not shown until enough of your network has signalled. Then the event on the calendar grows:

NETWORK SIGNALS	WHAT YOU SEE
1	A thin, quiet line. Real interest is never shown as nothing.
3	The event looks fuller.
8 or more	Sparkle, glow and a gentle pulse.

These numbers are a starting point (“we’ll see”, said the owner) and can be tuned after launch. Organisers see total interest as a sign an event is worth funding; the first version shows that signal but leaves the act of funding out, though the mock shows a “Fund it” tile. The glow itself is **not drawn in the screens in this note**.

◆ Maps, phone, and dark theme

- **Maps** reuse the map tiles NAOMS already serves. Nothing new to build.
- **On the phone**, the calendar lives inside the NAOMS mobile app's own bottom bar, alongside Photos, Files and Chat. It does not bring its own tab bar. The big yellow plus belongs to the app; the green plus on the calendar creates an event.
- **Dark theme** exists for every screen. It leads every pair here.

03 · The screens

Every screen is shown **dark first, then light**. Desktop is above, phone below. These are mock-ups with sample people and events; the photographs are freely licensed images, credited on the last page. The owner rejected an earlier version for looking like “a website in a window”, so these aim to feel like a modern app: a full-screen map, floating search, a beautiful list, and names you can actually read.

Some wording inside the pictures still says “channel”, and two screens are older than the linking change below (the request card and the unlink dialog). Each caption says where the real design differs.

Shots are cropped to the screen itself: the review controls that sit over the original captures (the desktop/phone and light/dark switches) are removed.

◆ Home: the map and what is on nearby

DARK · DESKTOP

LIGHT · DESKTOP

DARK · PHONE

LIGHT · PHONE

The whole window is the map. Events are photo pins you can tap; the list sits over it, with real photos and “Elin Voss, Marcus Cole and 12 others are going” so you can see who. On the phone, the yellow plus and the bottom bar are NAOMS’s own; the green plus creates an event.

◆ An event page

DARK · DESKTOP

LIGHT · DESKTOP

DARK · PHONE

LIGHT · PHONE

Where, when, a map, who is going, and the Interested / Going / Fund it tiles. “Shared with” sets who can see your interest (friends by default), and the card at the bottom says who posted it, through which organisation, and whether it is Public.

DARK · DESKTOP · THE POSTER'S OWN VIEW

LIGHT · DESKTOP · THE POSTER'S OWN VIEW

The person who posted a Public event also sees a green “Shared to Regen channel” confirmation at the bottom right (the final wording will say the regen calendar), so they know it went out. (Its phone version would look like the phone above until you scroll, so it is not repeated.)

◆ Creating an event

DARK · DESKTOP

The dark desktop view of the 'New gathering' form features a dark background with light-colored text and form elements. At the top, there's a back arrow and the title 'New gathering'. Below this is a 'COVER PHOTO' section with a placeholder image and a 'Change photo' button. A checkbox labeled 'I HAVE PERMISSION TO SHARE THESE PHOTOS (PEOPLE IN THEM AGREED)' is checked. The form includes fields for 'TITLE' (containing 'Open Studio: Clay & Dye'), 'DATE & TIME' (containing 'Sun, Oct 18 · 1:00 – 5:00 PM'), and 'PLACE' (containing 'Studio Row'). A section titled 'LOCATION ON THE MAP' has two buttons: 'Show exact location' and 'Show area only'. Below this is a 'DESCRIPTION' field with the text 'Wheel-throwing and natural indigo dye vats, side by side.' and a 'VISIBILITY' dropdown menu.

LIGHT · DESKTOP

The light desktop view of the 'New gathering' form has a light background with dark text and form elements. It follows the same layout as the dark version, with a back arrow, title, cover photo section, permission checkbox, and form fields for title, date & time, and place. The 'LOCATION ON THE MAP' section also includes 'Show exact location' and 'Show area only' buttons, followed by a description field and a visibility dropdown.

DARK · PHONE

The dark phone view of the 'New gathering' form is a mobile-optimized version with a dark background. It includes a back arrow, title, cover photo section, permission checkbox, and form fields for title, date & time, and place. The 'LOCATION ON THE MAP' section has 'Show exact location' and 'Show area only' buttons. Below the form is a description field. At the bottom, there's a navigation bar with icons for Photos, Files, a central '+' button, Chat, and a Calendar icon showing the date 17.

LIGHT · PHONE

The light phone view of the 'New gathering' form is a mobile-optimized version with a light background. It includes a back arrow, title, cover photo section, permission checkbox, and form fields for title, date & time, and place. The 'LOCATION ON THE MAP' section has 'Show exact location' and 'Show area only' buttons. Below the form is a description field. At the bottom, there's a navigation bar with icons for Photos, Files, a central '+' button, Chat, and a Calendar icon showing the date 17.

A photo, title, time and place. The place is matched offline to its town or city, from a list of about a thousand cities built into NAOMS, so no outside service is asked. That puts the event on the map at town level, and a place it cannot match simply gets no pin. The form also offers showing only the area, because a Public event shows its place to everyone who can see the regen calendar. The mock still shows a “people in the photo agreed” tick box; that has been dropped (see Privacy). Below the fold is the Internal / Public choice, starting on Internal.

◆ Stewards: accepting and managing links

DARK · DESKTOP

LIGHT · DESKTOP

DARK · PHONE

LIGHT · PHONE

A stand-in for the curators' side. In the real design a new organisation's request appears in the calendar stewards' **existing Approvals screen**, and a steward approves it there; this mock shows the same idea as a card with Accept and Decline. Whether the real card also offers Decline, and exactly which facts about the organisation it shows (the mock shows members, how it governs itself and when it started), is not settled. Underneath, the organisations already linked, each with Unlink, and one whose hive has ceased to exist.

◆ Unlinking an organisation

DARK · DESKTOP

LIGHT · DESKTOP

DARK · PHONE

LIGHT · PHONE

Unlinking asks what happens to what the organisation already shared. **“Purge history” really removes** its past events from the regen calendar for everyone who follows it, using the deletion mechanism NAOMS already has. It says plainly that copies someone already saved elsewhere cannot be recalled. Unlinking without it keeps the past events and stops future

ones. The wording inside this older picture (“hide”, “marked removed”, “channel calendar”) is out of date; the dialog will read: *“Purge history removes this organisation’s past events from the regen calendar for everyone who follows it. Copies someone already saved elsewhere can’t be recalled.”*

◆ Linking your organisation

No separate screen. An earlier mock showed a QR code and a link to send to a steward. That is gone. In the real design it is done in **your hive’s Trusted hives settings**: a steward adds the regen calendar there, and the request appears in the curators’ Approvals screen. While it waits, your hive shows that it is awaiting approval. There is no new screenshot for this because it reuses screens NAOMS already has.

◆ Privacy and sharing

DARK · DESKTOP

LIGHT · DESKTOP

DARK · PHONE

LIGHT · PHONE

Who sees your Interested / Going (Friends by default, or Friends + Business, or only you), and a plain statement of what leaves your hive: only Public events. Which hives are linked is a steward decision, not a personal setting.

◆ First run, empty, and offline

The small “First-run / Empty / Offline” switch at the top of these screens is a reviewer convenience in the mock, not part of the app.

DARK · DESKTOP · FIRST RUN

LIGHT · DESKTOP · FIRST RUN

DARK · PHONE

LIGHT · PHONE

First run. “Turn on the Regen calendar.” (The picture still says “channel”.) Nothing posts anywhere until you turn it on.

DARK · DESKTOP · EMPTY

LIGHT · DESKTOP · EMPTY

DARK · PHONE

LIGHT · PHONE

Empty. “No gatherings yet”, with a suggestion to check back or widen your filters.

DARK · DESKTOP · OFFLINE

LIGHT · DESKTOP · OFFLINE

Offline. A banner with the time of the last sync, and what you see is honestly labelled as of that time. The phone versions are left out here: on them a review control covers the banner text, so they would not show the screen truthfully.

04 · Privacy and trust, in plain words

The calendar works on trust: the owner chose this on purpose, because it is a community setting where the alternative — approving every post — would slow down exactly the sharing we want. That choice has consequences, and we would rather you read them here than discover them later. This section is what we looked for when we tried to break our own design, and what we did about it.

WHAT COULD GO WRONG	WHAT IT WOULD MEAN FOR A PERSON	HOW WE GUARD IT
An Internal event leaks out	A private meeting shows up on a public calendar.	Only events marked Public are ever sent. Internal events never leave the organisation: the sending side never sends them, and the receiving side rejects anything not marked Public.
A bad or abusive post from a linked organisation	It appears straight away, because there is no approval step for posts.	This is the deliberate cost of trust. The curators approve the <i>organisation</i> once, when it asks to link. After that they act <i>afterwards</i> : hide one event, hide one person's posts, or unlink the whole organisation and purge its history.
Someone pretends to post for an organisation	A stranger's post carries a linked organisation's name.	We can prove a post was signed by a real key and has not been altered on the way. Whether we can also prove the signer really belongs to the organisation is still being checked; if not, that leftover risk stays, as the owner accepted earlier (one more walk-through with him is still owed). Stewards noticing something odd is the first defence.
The signature check does not do what we thought	Forged or altered posts could slip through unnoticed.	Our own risk review found that a check the design first leaned on could quietly pass posts it should not. The design now uses a separate, explicit signature check, and the plan includes a test that a tampered post is rejected.
An organisation links to the wrong calendar	Its Public events would go to a look-alike "Regen Calendar" that is not the real one.	A steward picks the calendar deliberately from the hive list. A name alone cannot prove a hive is the genuine one; this is the same exposure as trusting any hive in Trusted hives, and we say so rather than hide it.
Your interest is seen by the wrong people	Someone you did not choose sees that you are Interested or Going.	Friends only by default; you can change it. The glow only appears once several people in your network have signalled, so one person is not singled out. We will also test that people outside the chosen audience never receive the signal at all. Still to do: confirm exactly which existing sharing mechanism enforces the friends-only rule; we will not build on an assumption.

A home address becomes public	A Public event held at someone's house puts the address on the map for the whole channel.	The create screen warns about it and offers "Show area only".
Photos of people who did not agree	A flyer or cover photo shows someone who never consented.	No tick box: every photo shared in NAOMS already carries a data contract that says who may see and pass it on, and the calendar checks that contract before a flyer is shared to another organisation. Every event also has a "Report photo" option. Once a photo has reached someone's device it cannot be pulled back.
"Delete" that cannot recall every copy	Someone believes an organisation's history is gone everywhere when a saved copy remains.	Purge history really removes the events for everyone following the regen calendar through NAOMS. It cannot recall copies someone saved elsewhere, such as a screenshot or an export, and the original record is not physically wiped yet. Whether pictures attached to events are covered is not confirmed. A formal legal request to erase personal data is a question we have not yet settled (see §05).
An organisation disappears	A linked hive that no longer exists keeps a place on the list.	The mock shows it as ceased; stewards can unlink it like any other.

One observation of ours, not from the sources. The glow starts as a thin line at the first network signal, while the fuller and sparkling looks wait for 3 and 8. A single signal could hint at which one friend it was. Whether to show anything at all for one signal is worth your eye. The owner has set 1 / 3 / 8+ and said the numbers can be tuned.

05 · Decisions for you

These are open. Nothing below is settled. Where there is a default that applies until you answer, we say so. A short reply on each is plenty.

DECISION 1 · Should interest fade over time?

The owner's view is that interest belongs to one specific event, is given once, and so *does not need to fade*. He asked us to put the question to you as well, so you can decide for your own model. The plan for NAOMS today is **no fade**.

OPTION	WHAT IT MEANS	IN FAVOUR	AGAINST
A. No fade OWNER'S VIEW	An Interested tap stays until the event happens.	Simple to explain. Nobody's tap quietly vanishes. The count means "people who said yes".	For events far in the future, the glow can reflect enthusiasm from long ago. OUR READING

DECISION 4 · Events with no firm date.

Some events in gathered data are “dates to be announced” or written as free text. We found no answer for this in the current design.

OPTION	WHAT FOLLOWS
A. Show them as “date to be announced”	Nothing is lost; the list needs a place for them and a way to be updated when the date is known.
B. Hold them back until dated	The calendar stays clean; people may not hear of an event until late.

DECISION 5 · The second “more thing”.

In the conversation, someone said there were “two more things” after the resonance idea, and the glow was the first. The second never arrived in what we have. If that was you, what was it? (We think it was you, but we have not confirmed who said it.)

DECISION 6 · Should every linked organisation be treated the same?

Some hives have stewards; some have none. Today a calendar steward simply approves or does not approve each organisation’s request in the Approvals screen, and there is no extra rule beyond that.

OPTION	WHAT FOLLOWS
A. Treat all alike (current default)	Any organisation a steward approves can post. Least friction. The owner has leaned this way, calling anything stricter “a bridge too far”, but has not formally closed the question.
B. Ask more of some organisations	For example, a minimum shape of governance before linking. More protection; more friction, and it shuts out consensus groups.

This question is about organisations. How the calendar hive’s own stewards decide among themselves is a separate, NAOMS-side matter.

For awareness, not for you to decide. The right to be forgotten. Once personal data has been shared on the calendar it cannot be fully erased. There is no NAOMS-wide legal ruling yet. Until there is, we say so honestly on screen. Someone will need to settle this before launch in places where it matters legally.

06 · What is next

The design was revised after the owner’s latest decisions on linking and purging, and the earlier risk review has been re-checked against the new model; that is where the section on trust above came from.

A few NAOMS-side details are still being settled; none of them needs an answer from you. In the order we expect to work:

1. **Your answers** to the decisions above.
2. **Early trials before building.** One confirms how the friends-only rule is enforced, so we reuse what exists. Others try the linking steps and the calendar-only reading end to end, because we have read the existing NAOMS parts they rely on but have not yet run them together.
3. **Test plan and alignment**, so every promise in this note is tested, including the failure cases.
4. **Build, in steps:** linking through the existing screens and the steward tools; Public events flowing across; the calendar on hives' spaces and the phone; then resonance and the glow.
5. **Two wishes not yet in the design.** From the earliest conversations: showing events “where you are that day”, and events with no firm date (Decision 4). We found no mention of either in the current design.

Thank you for building the thing this is growing from. We would far rather shape it with you than around you.

Sample content: all people, hives and events in the screens are invented for the mock-up.
