

NAOMS

NAO MEMORY SYSTEM · SOVEREIGN COMPUTE

DESIGN ALIGNMENT · WIKIBUDGET PORT · DESIGN V27

WikiBudget as a NAOMS app.

Brad's WikiBudget, rebuilt to run inside NAOMS: a community of experts writes a trusted, living budget for a whole area together. **The design is written and risk-checked**, the bridge model between hives is approved, and **239 tests are written first. Nothing is implemented yet**: every WikiBudget test fails today, by design.

WHERE TO START

§01 Summary and where things stand. What WikiBudget is in NAOMS, what changed today, and the honest status in one page.

§02 How cross-hive works. People bridge hives; hives do not talk to hives. The effect gate, recognition by vote, and disclosure before accepting.

§04 The app on screen. All 56 current screens of the mock, in the NAOMS desktop, on a phone, in light and dark.

§08 Tests and the state of the run, with counts and their snapshot time. **§09**, the questions for Brad and for Mujo.

FROM	Mujo · NAOMS sole owner
TO	Brad · author of WikiBudget
DATE	2026-09-29
ROADMAP	WikiBudget port · design v27 · mock v13
STATUS	Nothing is implemented. Tests are written first and fail today by design. The failing-test run on a separate test host is still in progress (§08).
ASKED OF	Feedback from Brad on the mock and the design; the decisions for Mujo (§09)

Public edition

This is the public edition of a document we sent to Brad.

Pages that are internal working detail, or that describe engineering items we have not finished, have been withheld, and internal item numbers have been removed. Nothing else has been changed.

Original document: 42 pages.

Withheld original pages: 3-4, 6-8, 12, 23-25, 29-42.

Original pages shown, in order: 1-2, 5, 9-11, 13-22, 26-28.

00 ■ Contents

- 01 Summary — what WikiBudget is in NAOMS, what changed today, where things stand
- 02 How cross-hive works — people bridge hives, hives do not talk to hives
- 03 Inside one hive — roots, branches, editors, member input, money
- 04 The app in NAOMS — launchpad, views, actions, honesty panels, settings
- 05 The bridge on screen — carrying a request in, the answer back, disclosure
- 06 Member input, editor-only controls, and the phone
- 07 Risks and how they are handled
- 08 Tests and the state of the run — all written first, all failing by design
- 09 Decisions and open questions — for Brad and for Mujo
- 10 Appendix — where things live

02 ■ How cross-hive works

Source: design section 4 and DE-104 to DE-125; `03-design/cross-hive-bridge-v1.md`. Example names come from the mock.

A member of both hives holds one identity in X and a different one in Y.
If the requester is offline or leaves, any other member of both hives can carry it.

A member of both hives holds one identity in X and a different one in Y. The requester carries the request in (1), Y decides on its own chain (2), and the answer is carried back (3).

- 1. Request in.** The requester copies the request for one quest into the funder hive. It is shown there as "requested for quest Q of hive X", carried by the requester's identity in Y. Nothing takes effect yet.
- 2. Y decides.** The funder hive answers through its own governance, on its own chain. A hive proposal is opened, holders vote from their own clients, and the answer is recorded when the proposal passes.
- 3. Answer back.** The answer is carried back into X. If nobody has carried it yet, X shows "sent, not yet confirmed, waiting for someone to carry it". A late answer is recorded and held; it is never called "void".
- 4. Display only.** A carried "yes" is shown as reported, not verified, and changes nothing.
- 5. Corroboration.** It can take effect only when a second carrier, who is not the requester and holds an editor credential, brings the same answer.

◆ The effect gate

A carried fact is **display-only until a second budget editor corroborates it**. The label always says "N carriers", never "verified". The words "signed proof" are not used: Phase 1 proof is "carried and vouched for by member X". A hive-signed proof is a later follow-up. If a second, different answer becomes eligible after the first was applied, the applied effect is suspended (`disputed`) until the source hive re-affirms.

04 ■ The app in NAOMS

WikiBudget opens as an app window inside the normal NAOMS desktop. **Every picture shows light mode on the left and dark mode on the right.** The mock is `03-design/mock/wikibudget-mock.html` (v13). Numbers 1 to 30 and 36 to 38 are the earlier screens; 40 to 62 are the bridge, member-input and editor screens. Six earlier pictures are retired and not shown (end of \$06).

◆ Launchpad, the main view, the budget picker

22. The NAOMS launchpad. WikiBudget is a tile under MONEY.

01. The main view: a treemap (boxes sized by share of the budget) at the top level, Oceans. Each sibling has its own pastel colour, a dot shows state, yellow marks the active tab, green is the Pledge button.

38. The budget picker: a sheet listing the budget instances you can open.

◆ Views: treemap, outline, hypertree

Three ways to look at the same budget. Selection and colours stay the same in all three.

02. The treemap drilled four levels down (Oceans, Acidification, Coral Impact, Reef Recovery Grants). The full path shows above it.

03. The outline view: an indented list, six levels open along the Reef Recovery Grants path.

04. The hypertree view: a round map centred on Nature Domains. The hypertree belongs to a later stage

18. The Mine filter is on. Branches where I have no allocation are dimmed.

19. Search for “reef” with the result list open.

◆ Doing things: prioritize, pledge, expert network, funding

The actions people take on a branch, without leaving the window. Prioritize, ratify and add-branch belong to editors; see 57 for what a member without the credential sees.

08. Funding requests panel with the funding-kind line and the tax note. WORDING PREDATES THE LEGAL RULING

29. A funding offer whose answer date has passed (past due). Accept and Decline stay clickable, and clicking shows the refusal.

30. A funding offer that has expired, with the refusal line shown.

12. The lock card on Plastics after “Request unlock”. A toast says the request went to the stewards.

13. Process B (a ranked election of stewards), open to vote. Membership is 9, which meets the rule of 6. Nominations closed, roster frozen, turnout 77.8% against a 60% floor.

14. Process B is not available on Acidification. It has 2 members and needs at least 6, so Process A governs.

15. My allocations, with “Remove my attribution” buttons and a note that the total share does not change. This applies to allocations inside the hive; what a bridge carries stays permanent.

36. A prioritize save refused because the numbers changed under you (stale allocation).

◆ Honesty panels

Places where the app shows the numbers, the limits and the caveats plainly instead of hiding them.

09. A node below the support threshold (Protection/Regulation): why, the numbers, and the freeze window.

10. Plastics is over-allocated. “The math” shows \$850M of claims against \$780M. Redistribution is capped (+3 points of a possible +6). Locked and over at once.

37. Plastics, locked and over-allocated: the conflict state shown on its own.

11. Rivers: a settlement that differs between two agreements, and the funders table with the investment note and tax note.

28. Rivers: labels on funders and settlements. “Unverified counterparty” or “verified by the rail provider”.

27. Acidification: a notice that its rules are weaker than the defaults (minimum supporters 2 vs 3, freeze window 10 minutes vs 1 hour).

17. Patron relationships ledger, with the investment note and tax note. The label becomes “Funder relationships” at build.

◆ Published view and the input comparison

These three pictures were made before design v27. Their layout stands; the audience line and the input labels are updated at implement (members only; input from members without an editor credential). The

corrected wording is in 56, 58 and 59.

16. The published view: a read-only, totals-only snapshot. AUDIENCE LINE PREDATES MEMBERS-ONLY; SEE 58

25. Editors' numbers and input side by side. Each column keeps its own scale; input bars are hatched.

EARLIER INPUT LABEL; NOW "N INPUTS FROM MEMBERS WITHOUT AN EDITOR CREDENTIAL"

26. The same comparison with the input view alone. EARLIER INPUT LABEL, SAME AS 25

◆ Settings

Settings open as a sheet over the live treemap.

20. Settings: Budget Instances.

21. Settings: Configuration (viability, expert network, Save defaults in yellow).

STILL SHOWS THE EARLIER INPUT CONTROLS; THE MEMBER-INPUT SETTINGS ARE 59

59. Settings, Configuration: a “Member input” toggle, a per-member limit and a pending cap. No proof-of-work control.

05 ■ The bridge on screen

Screens 40 to 49 and 62 are the cross-hive screens. 40 and 41 are in the requesting hive (Regen Commons); 42 and 43 are in the funder hive (Pacific Reef Trust).

◆ Carrying a request in and the answer back

40. Requesting hive: the answer carried back, “reported by the carrier, not yet verified”, 1 carrier, no effect.

41. The same answer after a second carrier (an editor, not the requester): “corroborated”, eligible to take effect, still not a signed proof.

42. Funder hive: a carried request “for quest Reef Recovery Grants of hive Regen Commons”, carried by the requester’s identity in this hive; the requester’s role is claimed, not verifiable.

43. The same request, carried by a substitute because the requester is not attached.

44. “Sent, not yet confirmed. Waiting for someone to carry it.” The reach line addresses the hive; no person is named.

45. Carry confirmation: your identity in the destination hive is attached.

46. A late answer is recorded and held, in neutral wording, with a take-up act for an editor. It is never called “void”.

47. Agreement one-sided: the legs are listed, a receipt is missing, and payment is refused because the agreement is not in force.

06 ■ Member input, editor-only controls, and the phone

◆ Members' input and editor-only controls

Only editor-credential holders edit. Every other member gives input, attributed to their hive pseudonym.

The mock's input copy is one step behind design v27. Screens 53 to 55, 59 and 61 still show earlier input wording (unattributed input, counted at an hourly batch). Design v27 removed it: every input is attributed and recorded one by one, with no batch and no unattributed option (DE-81, DE-82, DE-94, DE-120). The mock is corrected at implement; the tests assert the earlier copy is absent, so those arms are red against the mock today.

53. Member input form (the viewer is a member without an editor credential). **INPUT COPY PREDATES V27**

54. Per-member rate limit refusal (E27). **INPUT COPY PREDATES V27**

55. Pending cap refusal (E29). INPUT COPY PREDATES V27

56. An editor in the published view: input is for members without a credential; an editor edits with Prioritize.

57. A member without the credential on Plastics: a banner gives the honest reason, and Add Branch, Prioritize and Request unlock are disabled.

58. Publish confirmation with the members-only audience sentence.

Phone

On a phone the window fills the screen and the node panel sits below the treemap. Light on the left, dark on the right.

23. Phone: the treemap at Oceans.

24. Phone: the node panel for Plastics (Ratify, The math).
